# INTRODUCTION

## PROJECT OVERVIEW:

Drowsiness detection is the most necessary procedure to prevent any road accidents. The main aim of this project is to construct a smart alert technique for building intelligent vehicles that can automatically avoid drowsy driver impairment. Hence, it is required to design a robust alert system to avoid the cause of the mishap. In this project, we address a drowsy driver alert system that has been developed using such a technique in which the Video Stream Processing (VSP) is analysed by the eye blink concept through an Eye Aspect Ratio (EAR) and Euclidean distance of the eye. The face landmark algorithm is also used as a proper way to eye detection. When the driver's fatigue is detected, the IoT module issues a warning message along with the impact of collision and location information, thereby alerting with the help of a voice speaking.

## PURPOSE:

Many people drive on highway day and night. Bus drivers, truck drivers and people traveling long distance. This causes lack of sleep. Driving sleepy is very dangerous. Most of the accidents occur due to drowsiness of the driver. So to prevent these accidents we build a system using python. The objective of this python project is to built a drowsiness detection system that will detect that a person's eye are closed for few seconds. The system will alert the driver when drowsiness is detected. The purpose of this system is to aid in the prevention of accidents passenger and commercial vehicles.

It detects the early symptoms of drowsiness before the driver has fully lost all attentiveness and warn the driver that they no longer capable of operating the vehicle safely.

# CODING & SOLUTIONS

EYES OPEN

# ADVANTAGES & DISADVANTAGES

## ADVANTAGES:

- The drowsiness detection system is capable of detecting drowsiness in quickly. The system which can differentiate normal eye blink and drowsiness can prevent the driver from entering the state of sleepiness while driving.

## DISADVANTAGES:

- Aging of sensors are main disadvantage of this system and misconception of eye movement may be a disadvantage of this system.

## CONCLUSION:

Thus we conclude that, this drowsiness detection and alerting system is used if the drivers eyes are closed cumulatively more than a standard value, the system draws the conclusion that the driver is falling asleep, and then it will activate an alarm sound to alert the driver. A non-invasive system to localize the eyes and monitor fatigue was developed.

## FUTURE SCOPE:

- The system can be made more accurate using various other parameters such as State of the Car, Detecting Foreign Substances on Face etc.
- An application can be developed where it can alert or prevent the user from sleeping.
- It can be used to develop an IOT device that can be installed in the car to detect driver's drowsiness.
- Similar models and techniques can be used for various other uses such as Netflix, Hotstar and other streaming service platforms can detect whether the person is sleeping and stop the video accordingly.
